

ABSTRACT

A dolly with removably attachable riser blocks in which the connectors for attaching the riser blocks to the upper surface of the dolly are separate and distinct from the connectors used to attach the casters on the lower surface of the dolly. The dolly is comprised of a plastic frame having a top surface, bottom surface, a pair of longitudinal side members and a pair of transverse side members intersecting to form corners of the frame, constituting a generally rectangular shape. A caster is attached to each corner on the bottom of the frame with fasteners. At least one riser block is removably attached to the top surface of the frame on at least one of the transverse side members. The riser block is attached with riser block fasteners that are separate from the fasteners used to attach the casters, providing a dolly with removable risers.
